

CanYouCrackMeBaby2 - Writeup

Crackme: <https://crackmes.one/crackme/6a0bd0592b3df128c1df5c16>

<https://crackmes.one/crackme/6a0bd0592b3df128c1df5c16>

Binary: CanYouCrackMeBaby2.exe

Arch: x86-64 PE (Windows)

Tools: IDA Pro

Author: lgr0t7

Anti-Debug

The binary checks for running debuggers using `CreateToolhelp32Snapshot` + `Process32First/Next`. It looks for process names like `x64dbg.exe`, `ida.exe`, `ollydbg.exe`, etc. If found, it shows a message box and exits.

Bypass: Patch the conditional jump after the anti-debug call from `jz` to `jmp`, or just analyze statically.

Finding main

Open the Strings window (`Shift+F12`), find `"Input the pass:"`, press `X` for xrefs — this takes us to `main`.

The Trap (Fake Flag)

In `main`, the first check compares our input directly to a hardcoded string:

```
c
if(len==20&&!memcmp(input,"flag{can-you-crack?}",20))
```

This looks like the answer, but it's a **decoy** — entering it prints `"Access Denied"`.

The Real Check

If the first check fails, the program **XORs our input with 0x0A** and compares it to a ciphertext:

```
c

for(i=0; i< len; i++)
    input[i]^=0x0A;
if(len==18&&!memcmp(xored_input,"lfkm0cmx::~~boacdm",18))
```

The XOR key **0x0A** (10 decimal) is hardcoded as an immediate value in the instruction:

```
asm

140001e40 xor     byte ptr [rax+rcx], 0Ah
```

In the decompiler (F5) it appears as:

```
c

*((_BYTE*)v9+ v7++)^=0xAu;
```

To get the password, we reverse the XOR:

```
python

>>>''.join(chr(ord(c)^0x0A)for cin"lfkm0cmx::~~boacdm")
'flag:igr0t-theking'
```

Password: **flag:igr0t-theking**

Stage 2

After entering the correct password, it asks **"Say my name..."** and compares our input to:

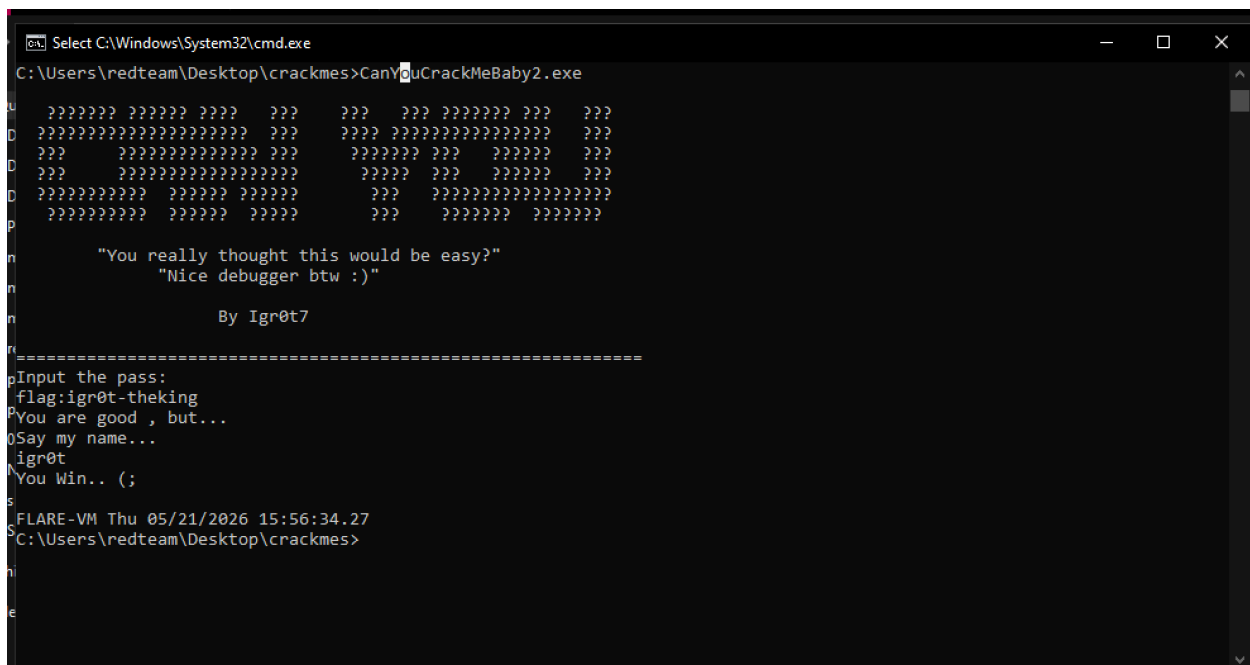

```
c

if(len==5&&!memcmp(input2,"igr0t",5))
    print("You Win.. (;");
```

Answer: **igr0t**

Solution

```
Input the pass:
flag:igr0t-theking
You are good , but...
Say my name...
igr0t
You Win.. (;
```

```
Select C:\Windows\System32\cmd.exe
C:\Users\redteam\Desktop\crackmes>CanYouCrackMeBaby2.exe
